3788. ACTIVE IMMUNIZATION AGAINST MUMPS WITH A SINGLE INTRADERMAL INJECTION OF LIVING VACCINE - Immunisation active contre les oreillons à la suite d'une seule injection intra-dermique de vaccin vivant - Smorodintsev A. A. and Klatchko N. S. Inst. Pasteur, Leningrad - REV. LYON MED. 1959. 8/1 (63-70) Graphs 6

A live-attenuated mumps vaccine for a single intradermal application was prepared from 5 laboratory virus strains which had lost their pathogenic properties for man as a result of 17-40 passages in developing chick embryos. Immunization was carried out in 4,116 out of 9,863 children without history of mumps, aged 3-6 yr., in 157 kindergartens in Leningrad. Vaccination was highly effective. There was a 10-fold decrease incidence among the vaccinated children as compared with unvaccinated control children (423 cases of infection in the control group, 30 in the vaccinated group). The coefficient of effectiveness was constant in different kindergartens and at different periods after immunization. Occasional cases of mumps reported in vaccinated children had a mild course and no spread was observed in the control group of children in vaccinated communities. In 10 kindergartens in which the first infection occurred in a vaccinated infant, only one additional case of infection took place, whereas in half of 45 kindergartens into which the virus was introduced by a control infant, 2 to 36 additional infections were reported. The innocuousness of the live vaccine has been confirmed by a 2nd immunization experiment in 30,000 infants and young schoolchildren carried out by practical workers.

SYMPTOMS

The authors have studied the harmlessness and immunogenic properties of live poliomyelitis vaccine made in Leningrad from strains of live pathogens for monkeys. More than 30,000 children of preschool (6 months to 3 years) and school age (7-14 years) were examined. The live vaccine was administered in two doses, separated by an interval of 1 month, or in two doses, in the form of inoculations, or in two doses, a month apart. The first dose was given 1 month after a single oral injection of diphtheria vaccine of types 2 and 3. The reactogenicity caused no symptoms of lesions of the central nervous system or other organs. In the blood of the vaccinated children there was rapid buildup of antibodies against diphtheria toxin. The antibody titer was stable for 1 year. After the second dose of the live vaccine there was a similar increase in the multiplication of the antibody titer. The antibody titer was reinforced at a high level for 6 months after immunization and fell a little after 12-18 months. The reacted virus easily transferred from vaccinated children to contact persons, which are gradually sensitized. The authors also studied the immunogenic properties of a live attenuated strain of second strain through the intestinal canal of normal, healthy children showed that strains may periodically appear which have a higher reactivity (activity) for monkeys. This activity, however, did not increase in subsequent passages and remained at the initial level.

PHASE I BOOK EXPLOITATION SOV/5435

Kiselev, P. N., Professor, G. A. Gasterin, and A. I. Strashinin, Eds.

Voprosy radiobiologii. t. III: Sbornik trudov, posvyashchenny 60-letiyu so
dnyu rozhdeniya Professora M. N. Pobedinskogo (Problems in Radiation Biology.
v. 3; A Collection of Works Dedicated to the Sixtieth Birthday of Professor
M[ikhail] N[ikolayevich] Pobedinskiy [Doctor of Medicine]) Leningrad.
Tsentral. n-issl. in-t med. radiologii M-va zdravookhrananiya SSSR, 1960.
422 p. 1,500 copies printed.

Tech. Ed.: P. S. Peleshuk.

PURPOSE: This collection of articles is intended for radiobiologists.

COVERAGE: The book contains 49 articles dealing with pathogenesis, prophylaxis,
and therapy of radiation diseases. Individual articles describe investigations
of the biological effects of radiation carried out by workers of the Central
Scientific Research Institute for Medical Radiology of the Ministry of Public
Health, USSR. [Tsentral'nyy nauchno-issledovatel'skiy institut meditsinskoy
radiologii Ministerstva zdravookhraneniya SSSR] during 1958-59. The following

Problems in Radiation Biology (Cont.)

SG7/5435

topics are covered: various aspects of primary effects of radiation; the course of some metabolic processes in animals subjected to ionizing radiation; reactions in irradiated organisms; morphologic changes in radiation disease; and reparation and regeneration of tissues injured by irradiation. Some articles give attention to the effectiveness of experimental medical treatments. No personalities are mentioned. References accompany almost all of the articles.

Immunological and Epidemiological Effectiveness of Live Poliomyelitis Vaccine in the USSR*

O. N. CHIKINSKAYA, A. I. DIONYSIUK-SKAYA, N. P. BULYCHY
A. A. MONGOLINSKAYA, A. I. DIONYSIUK-SKAYA, N. P. BULYCHY

In 1959 a total of 170000 children up to 10 years old in the Latvian, Reth-

estian, Moldavian and Russian Republics of the USSR were given live polio-

vaccine prepared from attenuated Sabins strain. The results show that the vaccine

is highly effective and quite innocuous.

The main reduction in poliomyelitis incidence in the different regions is reported
from 1958 to 1960, and among very young children (the age group at greatest
risk) as high as 1/4. In regions where live polio-vaccine was administered in the
earliest days of poliomyelitis epidemics, either 1 or over 10% of cases were found that had not
been immunized. This indicates that the rate of passive transmission was
significantly less than that of child-to-child transmission. Children in general
have close contact with their peers. This would then help to spread the disease
by person to person. The vaccination of children and teenagers may therefore
therefore represent an additional factor in the control and prevention of
poliomyelitis in order gradually to eliminate the occurrence of paralytic and non-paralytic
cases.

The optimum immunization schedule appears to be a first inoculation with live polio-

vaccine, a second inoculation 4 weeks later with diphtheria-tetanus-pertussis and

a third inoculation with trivalent after a similar interval.

SUMMARY MELICA Sec 4 Vol 12/3 Med. Micro. Mar 59

1019. THE EFFECT OF X-RAY IRRADIATION ON THE COURSE OF EXPERIMENTAL INFLUENZA INFECTION IN WHITE MICE AND RATS - Smorodintseff Jr A. A., Bacteriol. Lab., Centr. Res., Inst. of Roentgenol. and Radiol., Leningrad - ACTA VIROL. (Bratislava) 1957, 1/3-4 (145-155) Graphs 5 Tables 1 Illus. 2

Susceptibility to infection with influenza virus increases considerably in white mice and rats irradiated with X-rays. Mortality of infected animals and virus proliferation in the lungs depend on the dose of radiation and the interval between irradiation and infection. Preliminary total body irradiation results in prolonged survival of virus in the lungs. Preliminary irradiation and subsequent infection with slightly pathogenic strains result in macroscopically visible pneumonia. This is not found in non-irradiated animals. Thirty-two to 48 hr. after infection of white mice with type A₁ influenza virus of low pathogenicity, a large number of basophil inclusion bodies is found in the protoplasm of epithelial cells of the trachea and bronchi. Later the same inclusions are found in the epithelium of the small bronchi. In addition acidophil bodies are formed around these basophil inclusion bodies. Degeneration and destruction of epithelial cells in the trachea and large bronchi appear in irradiated mice. In small bronchi this process leads to separation of whole epithelial layers. In non-irradiated animals such severe changes are never found. A similar picture is only observed in non-irradiated mice infected with strains of high pathogenicity. Preliminary irradiation depresses formation of antibodies. The degree of suppression is proportional to the dose of irradiation.

SUBJECT USSR/MATHEMATICS/Theory of functions CARD 1/3 PG - 645
 AUTHOR SMOROVIC V.A.
 TITLE On some classes of functions being analytic in the circular ring.
 PERIODICAL Mat.Sbornik, n. Ser. 40, 225-238 (1956)
 reviewed 3/1957

Let $K_z(r; R)$ and $K_z[r; R]$ ($0 < r < |z| < R$ and $0 < r \leq |z| \leq R$) be the circular rings $0 < r < |z| < R$ and $0 < r \leq |z| \leq R$. To the function class $B(r; R)$ there belong all functions being unique, analytic and regular in $K_z(r; R)$ which satisfy the condition

$$\int_{-\pi}^{\pi} |\operatorname{Re} f(\xi e^{i\varphi})| d\varphi < L(f) \quad (r < \xi < R),$$

where $L(f)$ is a positive constant depending on $f(z)$. Let a function belong to the class $B_n(q; 1)$ if it is unique and meromorphic in $K_z(q; 1)$, in this ring possesses a finite number of poles of at most n -th order and if it belongs to the classes $B(q; q+\delta)$ and $B(1-\delta; 1)$ for sufficiently small $\delta > 0$.

Theorem: Necessary and sufficient that $f(z)$ belongs to the class $B_n(q; 1)$ is the representability of $f(z)$ in the form

$$f(z) = \sum_{k=1}^n \omega(z; a_k, c_k) + \frac{1}{2\pi} \int_{-\pi}^{\pi} F(z e^{-i\varphi}) d\mu_1(\varphi) + \frac{1}{2\pi} \int_{-\pi}^{\pi} F\left(\frac{q}{z} e^{i\varphi}\right) d\mu_2(\varphi) - \alpha + i\beta,$$

Mat. Sbornik, n. Ser. 40, 225-238 (1956)

CARD 3/3

PG - 645

7) $M_j(\varphi)$ ($j=1,2$) is unique, real, of bounded variation on $[-\pi, +\pi]$ and normalizes $M(\pi+0) = M(\pi) = 0$.

Furthermore several other similar function classes are introduced and necessary and sufficient conditions that a function belongs to these classes are given.

TITLE: Production of seamless bimetallic pipes

SOURCE: Metallurg, no. 5, 1964, 29-31

TOPIC TAGS: pipe production, seamless pipe, bimetallic pipe, hot rolling, pressing, drawing, cold rolling, centrifugal pouring

ABSTRACT: This review of the seamless pipe production methods was compiled in order to choose the best technique for the production of bimetallic pipes. The use of such pipes is increasing because they require much smaller quantities of rare and costly metals and alloys. A stable diffusive bond between two metals is usually produced by simultaneous hot pressing, rolling, and drawing of both layers in a continuous rolling mill. Normally a plant couples such a mill to various cold rolling and drawing machines. The product consists of a thick hot-rolled or pressed pipe and of a thin shell which serves as a plating material. If the inside of the pipe is to be plated, the shell is inserted into the pipe and flared in a drawing mill. The outside plating requires a simultaneous drawing of both elements.

Card 1/2

ACCESSION NR: AP4039006

Theoretically, this procedure is based on the layered body deformation theory developed in the UkrNITI. Investigations revealed the following basic conditions to be required for optimal results. After cleaning, the contacting surfaces should be pressed together immediately to prevent possible pollution. In order to avoid oxidation of the contacting surfaces the two-layer fagot should be heated to the welding temperature during deformation. The process of hot deformation should be carried out in such a way as to secure high specific pressures at the contact surfaces, a uniform deformation in the longitudinal and transverse directions, and a minimum drop in temperature. Superior results in production of seamless bimetallic pipes were obtained by centrifugal casting with subsequent rolling or pressing. This procedure did not require the operations associated with the cleaning of the contact surfaces. The author concludes that the centrifugal casting method requires and deserves further investigation.

TITLE: Extrusion of bimetallic steel-copper pipes

SOURCE: Metallurgicheskaya i gornorudnaya promyshlennost', no. 1, 1966, 41-43

TOPIC TAGS: pipe, metal extrusion, bimetal, metal cladding

ABSTRACT: Bimetallic pipes of No. 10 steel and M3S copper were extruded on a vertical 1500 T power press (container $\varnothing=150$ mm, die $\varnothing=74$ mm, punch $\varnothing=64$ mm, temperature 900 to 920°C, graphite oil and 10% salt lubricant). The pipe sections were 4000 mm long, had an outside diameter of 73.5 mm and total wall thickness of 5 mm. Thickness of the inside copper layer ranged from 0.20--0.25 to 0.90 mm. The extrusion technique is described. Inspection of finished pipe indicated a relatively uniform distribution of copper cladding over the length of the pipe. Copper thickness below 0.90 mm resulted in substandard material. It is concluded that the technology described can be employed to manufacture steel pipe with inside copper cladding as a finished product or as a final billet. Orig. art. has: 3 figures and 2 tables.

TITLE: Production of isoprene from dimethyldioxan. I. The
role of catalyst and support

PERIODICAL: Zhurnal obshchey khimii, v. 32, no. 12, 1962,
3987-3990

TEXT: In connection with work carried out at the authors' Institute in Bucharest on the production of isoprene from isobutylene and formaldehyde via 4,4-dimethyl-1,3-dioxan (DM), the effect of the composition of the catalyst for the vapor-phase conversion of DM to isoprene on its selectivity, isomerizing effect, etc. has been studied. Standard conditions found to be optimal in preliminary experiments were used, namely: 270°C and a space velocity of feed of DM of 0.4 hr⁻¹. The highest activity was possessed by a catalyst consisting of acid calcium phosphate on a silica/5% alumina support, the nature of the support being important. With this cata-

Card 1/2

Production of isoprene ...

S/079/62/032, 012/004/003

D424/D507

lyst, the selectivity fell as the temperature was increased from 150 to 350°C but the maximum total conversion (~65%) was obtained at ~ 300°C, the selectivity then being of the order of 85%. By-products found (by gas chromatography) included isobutylene, 2-methylbut-2-ene, methyldihydroxyran, 2-methylbutan-1-ol, isovaleraldehyde, and dimers and trimers of isoprene. The fact that the support alone had a small catalytic activity due to its lewis acid sites and leading mainly to isobutylene is considered to show that the activity of the calcium phosphate catalyst depends on the presence of Brönsted acid sites. The catalyst is not appreciably affected by the usual impurities in EMD but is poisoned by sulfur (mercaptans). It can also be used for the production of other dienes, e.g. 2-phenylbutadiene, by analogous reactions. There are 5 figures.
